

How to mount a WiFi antenna on the side of a building

In some cases it may not be possible to install a WiFi antenna on a standard vertical mast or pole, or depending on your application, you may need to attach a WiFi antenna to the side of a building or structure. L-com offers the HGX-UMOUNT universal antenna mount to address these side of building WiFi antenna installations. In the diagram below two of L-com's [HGX-UMOUNT](#) brackets are connected to a HyperLink® brand [HG2414SP-090 sector antenna](#). This mounting option will work with sector style antennas that have two (one upper and one lower) mounting points as well as with standard [flat panel antennas](#) and [Omni antennas](#) using just one HGX-UMOUNT (see diagram below).
